

Food Hygiene & HACCP Basics

New Staff Onboarding Training

Welcome to the Team

This training gives every new production employee the basic food hygiene and HACCP knowledge needed before starting on the floor. It takes about 30 minutes and ends with a short review.

Why it matters

Protect consumers and keep our products safe to eat.

What you'll learn

Basic hygiene rules and the 7 HACCP principles.

What's next

A short quiz and sign-off with your supervisor.

Why Food Safety Matters

People fall ill from contaminated food every year worldwide (WHO estimate)

Diseases are known to be caused by unsafe food, from diarrhea to cancer

Mistake at your station can affect an entire batch — and every customer who buys it

Every hygiene rule you' ll learn today exists because of a real risk it prevents.

Personal Hygiene Rules

Wash hands often

Before starting work, after breaks, the toilet, and touching your face or hair.

Cover hair & beard

Hairnets and beard covers must be worn at all times on the floor.

Cover cuts & wounds

Use a brightly colored, waterproof dressing and a glove over it.

Remove jewelry

Rings, watches, and loose jewelry can carry bacteria or fall into product.

Report illness

Tell your supervisor before starting if you have vomiting, diarrhea, or fever.

No eating/smoking on floor

Eat, drink, chew gum, and smoke only in designated break areas.

The 4C's of Food Hygiene

Four habits that prevent almost every common food safety failure.

Cleaning

Wash hands, surfaces, and equipment regularly to remove harmful bacteria.

Cross-contamination

Keep raw and ready-to-eat foods, tools, and surfaces separate.

Chilling

Keep cold foods at or below 5° C (41° F) to slow bacterial growth.

Cooking

Cook food to at least 74°C (165°F) internal temperature to kill pathogens.

Part Two

Introduction to HACCP

What Is HACCP?

HACCP stands for **Hazard Analysis and Critical Control Points**. It's a system for spotting food safety hazards before they happen, instead of catching problems after the fact.

Hazard Analysis

Identifying biological, chemical, or physical risks that could make food unsafe — like bacteria, cleaning chemicals, or glass fragments.

Critical Control Points

The exact steps in the process — like cooking or chilling — where control is essential to prevent or eliminate a hazard.

The 7 Principles of HACCP

1 **Conduct a hazard analysis** — identify what could go wrong at each step.

2 **Determine critical control points** — where hazards must be controlled.

3 **Set critical limits** — the maximum or minimum value, like a temperature.

4 **Establish monitoring** — checking and recording each critical point.

5 **Establish corrective actions** — what to do when a limit is not met.

6 **Verify the system** — confirm HACCP is working through checks and audits.

7 **Keep records** — documentation proves the system was followed correctly.

Your Role at a Critical Control Point

If your station is marked as a CCP, you have specific responsibilities. Example: a cooking step with a minimum temperature limit.

Check and record the temperature at the set frequency (e.g., every batch).

Step 1

If the limit is not met, stop and alert your supervisor immediately.

Step 2

Never release product that failed a critical limit check.

Step 3

Every check gets logged — no log means no proof it was done.

Step 4

Common Mistakes to Avoid

Skipping a hand wash "just this once"

Bacteria transfer in seconds — there's no safe shortcut.

Using the same board for raw and cooked

This is one of the most common causes of cross-contamination.

Guessing instead of measuring temperature

Always use a calibrated thermometer — never estimate by sight or touch.

Not reporting a missed check

A late or missing record must still be reported — never backfilled silently.

Quick Knowledge Check

1. What does the "C" in "Chilling" mean for cold food storage?

Keep cold food at or below 5° C (41° F).

2. What should you do if a critical limit at your station is not met?

Stop, hold the product, and alert your supervisor immediately.

3. Name two of the 7 principles of HACCP.

Any two of: hazard analysis, critical control points, critical limits, monitoring, corrective actions, verification, record-keeping.

Discuss your answers with your supervisor before signing off on this training.
